College of Information Technology Education

Chapter 1

Introduction to the Study

In the current digital era, the internet has transformed how people use and access services, making things that were previously inaccessible resources now are convenient and accessible.

Car rental is the type of temporarily renting a vehicle, like an automobile, for a specific period of time. As the technology is expanding and developed more, this improvement is particularly clear in the field of communication, where the internet serves as a critical tool for connecting people globally. Because of quick development of technology, many industries like businesses have face a digital transformation which has transformed manual procedures into automated systems and one important sector going through this change is the rental vehicle sectors.

Online car rental system assists RCM car rental company in maintaining things running smoothly. Does a lot of things, such as help manage the vehicles, handle reservations, as well as monitor customers. This system makes it easier for RCM car rental company to manage their cars, check what's available, make reservations and handle returns as well and also the information gets recorded safely. As technologies nowadays is expanding rental companies need to step up. The goal here is to create a system with a simple interface that the process in renting is easy and convenient.

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

Technical Background of the Study

Car rental management plays a vital role in the transportation industry, providing customers with flexible mobility solutions while helping companies efficiently manage their fleet of vehicles. Traditionally, many car rental operations relied on manual booking systems, paper-based records, or simple spreadsheets to track rentals, reservations, and payments. However, these methods often lead to errors, double bookings, delayed transactions, and inefficiencies in managing vehicle availability and maintenance schedules. With the increasing demand for convenience and real-time service, businesses are now turning to automated and web-based car rental management systems.

An RCM Online Car Rental System integrates modern technologies to provide smooth operations, improve customer service, and optimize fleet management. Key technologies involved in such systems include:

1. Web-Based Application:

A centralized online platform enables users to browse available vehicles, make reservations, and manage bookings anytime and anywhere. It provides both the customers and administrators with easy access to the system through a web browser, ensuring convenience and accessibility.

2. Database Management System (DBMS):

The use of a relational database, such as MySQL allows for efficient storage and management of customer details, vehicle information, rental records, and payment transactions. This ensures data consistency, integrity, and quick retrieval of information.

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

3. Cloud Computing:

Cloud-based hosting enhances the scalability and reliability of the system. It allows real-time data synchronization between different branches, secure backup of records, and remote access for both administrators and users.

4. Online Payment Integration:

Incorporating secure online payment gateways simplifies the transaction process. Customers can conveniently pay for their rentals using credit cards, e-wallets, or bank transfers, reducing manual handling of payments and minimizing errors.

Statement of the Problem

Efficient management of car rental operations is crucial for ensuring customer satisfaction, maximizing fleet utilization, and maintaining business profitability. However, many car rental companies still depend on traditional, manual methods for handling reservations, tracking vehicles, and processing payments. These outdated approaches often result in human errors, inefficiencies, and delays that negatively affect both customers and administrators. As the demand for fast, convenient, and technology-driven services increases, manual systems can no longer keep pace with the dynamic needs of the modern car rental industry.

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

Car rental businesses often face the following problems with traditional management systems:

1. Inaccurate Record Tracking:

Manual recording of rental transactions, vehicle availability, and customer details can lead to data inconsistencies, double bookings, and difficulty in tracking vehicle status. These inaccuracies can cause customer dissatisfaction and loss of business opportunities.

2. Time-Consuming Transactions:

Processing reservations, payments, and vehicle returns manually requires significant time and effort from employees. This slows down service delivery and reduces overall productivity.

3. Lack of Real-Time Updates:

Traditional systems fail to provide real-time information about vehicle availability, ongoing rentals, or maintenance schedules. As a result, staff and customers may rely on outdated data, leading to scheduling conflicts and operational delays.

4. Poor Data Management and Reporting:

Manual documentation makes it difficult to generate accurate reports on vehicle utilization, revenue, and customer trends. This hinders management from making informed, data-driven decisions.

5. Limited Accessibility and Communication:

Without an online platform, customers must visit the rental office or contact staff directly to make inquiries or reservations. This lack of accessibility can inconvenience customers and limit business reach.

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

This study seeks to address these problems by developing the RCM Online Car Rental System, a web-based platform that integrates database management, cloud technology, and online payment systems. The goal is to provide real-time vehicle availability updates, smooth booking and transaction processes, and enhance data accuracy and security. Through this system, RCM aims to improve operational efficiency, reduce errors, and deliver a more convenient and reliable car rental experience for customers.

Objectives of the Study

The main objective of this study is to design and develop a Car Rental Management System that improves the operational efficiency, customer service, and profitability of the RCM car rental business. The specific objectives of this study are as follows:

- 1. To design an automated system for real-time fleet tracking and management:** This will include integrating modules for vehicle reservations, check-in/check-out processes, and maintenance scheduling to track car availability and status automatically.
- 2. To develop a user-friendly interface for customers and staff:** The system will feature an easy to understand and easy to use customer portal for online bookings and a separate management dashboard for staff to handle rentals, monitor fleet status, and generate reports with minimal effort.
- 3. To reduce operational costs and manual errors:** By automating key processes such as billing, reservation

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

management, and maintenance alerts, the system will minimize administrative overhead, reduce the risk of double-bookings and calculation errors, and improve overall efficiency.

4. To evaluate the system's performance and

effectiveness: This will involve testing the system's core functionalities—such as the booking process, payment integration, and report generation—in a controlled environment to assess its reliability, usability, and overall impact on rental operations.

5. To ensure the system's scalability and adaptability: The Car Rental Management System will be designed to accommodate business growth, with the ability to scale from a single location to multiple branches and adapt to different vehicle types and rental models.

Significance of the Study

This study is significant because it addresses common operational challenges faced by car rental businesses, such as manual booking errors, inefficient fleet management, and poor customer service. Traditional methods, which often rely on disparate records and manual processes, can lead to double-bookings, inaccurate billing, and vehicle downtime. By developing an Online Car Rental Management System, this study aims to streamline operations, enhance customer satisfaction, and improve the overall profitability of the RCM car rental business.

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

The key benefits of this study include:

1. **Improved Operational Efficiency:** Automation of key processes like reservations, billing, and maintenance scheduling will reduce the time staff spend on administrative tasks, allowing them to focus on delivering better customer service.
2. **Reduced Errors and Over bookings:** Ensuring accurate data, bookings and billings the system will minimize human errors by providing a single, reliable source of truth for vehicle availability and customer data.
3. **Cost Savings and Revenue Optimization:** The system will help maximize the revenue-generating potential of each vehicle and reduce costs associated with unexpected repairs and vehicle downtime by enhancing fleet utilization and providing maintenance alerts,
4. **Scalability and Business Growth:** The system is designed to be scalable, allowing the RCM business to easily expand its operations to multiple locations or increase its fleet size without requiring a complete revision of its management software.
5. **Enhanced Customer Satisfaction:** By providing a user-friendly online booking platform, ensuring vehicle availability, and streamlining the pick-up and drop-off process, the system will significantly improve the customer experience, leading to increased loyalty and repeat business.

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

Scope and Limitation of the Study

This study focuses on the development of an Online Car Rental Management System designed to streamline the operations of the RCM car rental business. The key features of the system include online reservations, real-time fleet management, automated billing, and maintenance scheduling. The study will cover the design, development, and implementation of the system, including:

1. **Online Reservation and Booking Management:** Developing a web-based platform for customers to check vehicle availability, make reservations, and manage their bookings online.
2. **Fleet Management Module:** Creating a system for staff to track vehicle details, availability, status like availability and if under maintenance.
3. **Automated Billing and Payment Integration:** Implementing a module to generate invoices automatically and integrate with a payment gateway to process online transactions securely.
4. **Maintenance Scheduling and Tracking:** Developing a feature to schedule, track, and manage vehicle maintenance to minimize downtime and ensure fleet reliability.

The system will be designed specifically for car rental businesses. The scope includes the development, testing, and evaluation of the software system in a controlled environment to assess its functionality and usability.

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

Limitations of the Study

While the study aims to address several aspects of car rental management, there are some limitations:

1. **Business Model Scope:** The system is primarily designed for standard car rental operations. It may not fully support more complex models like car-sharing, subscription services, or long-term leasing without significant modifications.
2. **Technology Constraints:** The system's functionality is limited to the software platform. It will not include the development of hardware components such as GPS trackers for real-time vehicle location or IoT sensors for vehicle diagnostics, though the system architecture may allow for their future integration.
3. **Implementation Scope:** The study focuses on the development and testing of the software application. It will not cover the full-scale deployment, staff training, or the marketing required for a commercial launch to the public.
4. **Internet dependent:** the system is dependent on stable internet connection to ensure real-time functionality from bookings, payments and data updates.

Definition of Terms

1. **Car Rental Management System:** A software platform designed to automate and manage the core operations of a car rental business, including reservations, fleet tracking, customer management, billing, and maintenance scheduling.
2. **Online Reservation System:** A web-based module that allows customers to check vehicle availability, compare options,

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

and book a rental car remotely via the internet, without needing to visit a physical office.

3. **Fleet Management:** The process of overseeing and coordinating a company's vehicles. In this context, it involves tracking vehicle details, status (e.g., available, rented, under maintenance), location, and utilization rates.
4. **Real-time Availability:** The instantaneous and accurate reflection of which vehicles are available for rent at any given moment, preventing double-bookings and ensuring customer confidence.
5. **Automated Billing:** A system feature that automatically generates invoices and calculates rental charges based on the duration of the rental, selected vehicle, and any additional services or fees, minimizing manual calculation errors.
6. **Payment Gateway:** A secure online service that processes credit/debit card transactions, facilitating the acceptance of electronic payments for bookings and securing sensitive customer financial data.
7. **Maintenance Scheduling:** The process of planning and tracking routine and ad-hoc vehicle servicing to ensure the fleet is safe, reliable, and to minimize unexpected downtime.
8. **User Interface (UI):** The visual and interactive part of the car rental system through which users (both customers and staff) interact. It includes elements like menus, buttons, forms, and data displays.
9. **User-friendly Interface:** A design approach that ensures the system is intuitive, easy to navigate, and requires minimal

PHINMA UNIVERSITY OF ILOILO
College of Information Technology Education

training for staff and customers to accomplish their tasks efficiently.

10. **Centralized Database:** A single, unified repository that stores all critical business data—such as customer information, vehicle records, rental transactions, and maintenance history—ensuring data consistency and integrity.
11. **Cloud-based System:** A software architecture where the application and its data are hosted on remote servers and accessed via the internet, allowing for remote access, easier scalability, and reduced need for on-premise hardware.
12. **Data Analytics:** The process of examining rental data to uncover patterns, trends, and insights related to vehicle popularity, peak rental periods, and revenue performance to support strategic business decisions.
13. **Fleet Utilization Rate:** A key performance indicator (KPI) that measures the proportion of time the rental fleet is being used to generate revenue compared to its total available time.
14. **Operational Efficiency:** The ability of the car rental business to maximize its output (rentals) while minimizing wasted resources, time, and costs through the automation of manual processes.
15. **Scalability:** The capability of the car rental system to handle a growing amount of work, such as a larger fleet, more rental locations, or a higher number of concurrent users, without a drop in performance.
16. **System Testing:** The phase of development where the completed car rental system is evaluated to verify that it

PHINMA UNIVERSITY OF ILOILO
College of Information Technology Education

functions as intended and meets the specified requirements before it is deployed.

17. **Controlled Environment:** A testing setting that simulates real-world operations but is isolated from live business activities, used to identify and fix bugs without disrupting actual customers or transactions.
18. **Double-booking:** An error situation where the same vehicle is inadvertently reserved for two different customers for overlapping time periods, which a robust management system is designed to prevent.
19. **Vehicle Downtime:** The period when a vehicle is unavailable for rental, typically due to maintenance, repairs, or cleaning, which the system aims to minimize through efficient scheduling.
20. **Customer Portal:** A dedicated, secure section of the system designed for customers to manage their own profiles, view booking history, and make or modify reservations.

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

Chapter 2

Review of Related Literature

This chapter presents existing studies and literature related to online car rental and fleet management systems. It discusses the evolution of car rental operations, the role of web-based technologies, database integration, and the impact of such systems on business performance. The review is supporting the importance of implementing an integrated online car rental system for enhancing operational efficiency and customer service.

Car Rental Operations and Management

According to Barta et al. (2020), the car rental industry is highly competitive, where operational efficiency and customer service are key differentiators. Traditional, manual rental processes are often plagued by inefficiencies, such as double-bookings and inaccurate fleet records, which can lead to customer dissatisfaction and revenue loss. The shift towards digitalization is therefore not just an option but a necessity for survival and growth in the modern market.

Web-Based and E-Commerce Systems in Car Rental

The adoption of e-commerce principles has fundamentally changed service industries, including car rentals. As noted by Laudon and Travel (2021), a well-designed online reservation system acts as a 24/7 storefront, significantly expanding a business's reach and convenience for customers (p. 312). These systems allow users to compare vehicles, check real-time availability,

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

and complete bookings without human intervention, streamlining the entire customer acquisition process.

Database Integration for Centralized Management

The backbone of any effective online rental system is a robust and integrated database. As Rob and Coronel (2018) emphasized, a centralized database is crucial for maintaining data consistency across different modules, such as reservations, customer management, and fleet tracking (p. 156). Relational database management systems like MySQL or PostgreSQL are commonly employed to ensure data integrity, support complex queries, and enable secure transactions.

Automation and Fleet Management Efficiency

Automation is a critical driver of efficiency in rental operations. A study by Park and Kim (2019) found that automating key processes—such as billing, payment processing, and maintenance scheduling—reduces administrative overhead and minimizes human error (p. 102). An automated system ensures that fleet utilization is optimized by dynamically updating vehicle status and providing timely maintenance alerts, thereby maximizing asset productivity and reducing downtime.

Benefits of an Integrated Online Car Rental System

The implementation of a comprehensive online system leads to significant strategic advantages. Johnson et al. (2022) concluded that such systems provide valuable business intelligence through data analytics, allowing managers to identify rental trends, optimize pricing strategies, and make

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

informed decisions about fleet composition (p. 88). Ultimately, this integration results in cost savings, enhanced customer satisfaction, and a stronger competitive position.

Chapter 3

Methodology

This chapter outlines the research methodology that will be employed in the development of the "RCM Car Rental System." The primary goal of this research is to design and implement a comprehensive, web-based car rental management system that integrates modules for online reservations, fleet management, automated billing, and maintenance scheduling. This chapter will detail the research approach, data collection methods, system design, tools, and techniques that will be used to achieve this objective.

The research will adopt a systematic approach to ensure the effective development and implementation of the proposed system. Initially, a thorough review of existing car rental systems and related literature will be conducted to identify industry challenges, user expectations, and technological best practices. Based on this review, the methodology will proceed with the design phase, where the software architecture, user interfaces, and core components of the car rental system will be defined.

To gather valuable insights on user requirements and expectations, surveys and interviews will be conducted with key respondents, including rental agents, fleet managers, and potential customers. These respondents will play a crucial role in providing the necessary data for the system's design and functionality. Their feedback on current pain points and desired features will guide the development process, ensuring the system meets the practical needs of both staff and end-users.

Once the system is developed, it will undergo rigorous testing to assess its performance, usability, and efficiency. The testing phase will include unit testing of individual components,

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

integration testing to ensure modules work together seamlessly, and user acceptance testing (UAT) with a select group of end-users to validate the system's functionality in a real-world scenario. This chapter provides a clear understanding of the research methods and processes that will guide the study, ensuring that the project is executed in a structured and effective manner, leading to a robust and user-friendly car rental management solution.

Research and Development Stage

Software Development Life Cycle (SDLC)

The Software Development Life Cycle (SDLC) serves as a structured framework for the systematic development of the Car Rental Management System. It ensures that the system is planned, designed, developed, tested, and implemented in a methodical, efficient, and effective manner. The SDLC will provide a step-by-step process that guides the project from its initial planning stage up to its final deployment and evaluation, ensuring that all functional and user requirements are met throughout the development.

Key Features of Agile:

- **Iterative Development:** The system was built in small, incremental phases known as sprints, allowing progressive enhancement of features and functionalities.
- **Continuous Feedback:** Ongoing feedback from stakeholders such as car rental staff, potential users, and industry advisors was regularly integrated to refine and improve the system.

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

•**Collaboration:** Close coordination among developers, end users, and project consultants ensured that the system's design and functionality remained aligned with actual operational requirements.

•**Flexibility:** The Agile approach provided the ability to adapt to evolving requirements and make necessary modifications even during the later stages of development.

This methodology ensured that each phase of development remained user-centered, practical, and responsive to real-world car rental operations. The SDLC will consist of the following stages

1. Planning and Requirement Analysis

This initial phase of the SDLC focuses on gathering and analyzing the specific requirements of the Car Rental Management System. Input from respondents such as car rental operators, staff, and industry professionals will be crucial in identifying existing challenges and operational needs. Through surveys, interviews, and consultations, the researchers will determine the essential features, system functions, and technical requirements needed to optimize the car rental process. This stage will also establish clear project objectives, define the system's scope, and outline the development timeline.

2. System Design

During the system design phase, the overall architecture and structure of the Car Rental Management System will be established. Feedback from respondents will help shape both the

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

front-end user interface and the back-end components, including the database and system logic. The design will integrate modern technologies such as cloud computing and data analytics to ensure the system is scalable, secure, and user-friendly. This phase ensures that the system aligns with the functional and non-functional requirements identified during the planning stage.

3. Development

In the development phase, the actual coding and implementation of the Car Rental Management System will be carried out. Using the approved system design, developers will build the software using appropriate programming languages and tools. Respondents will continue to provide feedback by evaluating early prototypes, particularly in terms of usability, accuracy, and overall performance. This iterative process ensures that the system remains aligned with user requirements and operational expectations.

4. Testing

After development, the Car Rental Management System will undergo thorough testing to ensure its reliability and effectiveness. This includes functional testing to verify that all features operate correctly and performance testing to assess the system's capability to handle multiple users and large data volumes. Respondents will participate in User Acceptance Testing (UAT), where the system will be evaluated under real-world conditions to identify any issues or necessary improvements. Feedback gathered during this phase will be used to refine the system prior to full deployment.

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

5. Deployment

Once testing is successfully completed, the system will be deployed in a live operational environment. This phase includes the installation, configuration, and activation of the system to ensure it is fully functional and ready for user access. Initial user training will be conducted to ensure smooth adoption and proper system utilization. Respondents will continue to be involved during this phase to provide final insights and ensure the system meets practical operational needs.

6. Maintenance and Support

In the maintenance phase, continuous support will be provided to ensure the optimal performance of the Car Rental Management System. Respondents will offer feedback on system usability and functionality, helping to identify areas that require improvement. Regular updates, bug fixes, and feature enhancements will be implemented based on evolving user needs and industry demands.

Data Collection Techniques

To obtain comprehensive and reliable data for the analysis and evaluation of the Car Rental Management System, multiple data collection techniques will be employed. These methods are designed to capture insights from various stakeholders, including customers, rental staff, and system administrators, ensuring that both user experience and operational efficiency are thoroughly assessed.

1. Surveys:

A structured survey questionnaire will be administered to clients who have recently transacted with the car rental service. The questionnaire will consist of Likert-scale items to measure

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

user satisfaction, ease of use, system accessibility, booking efficiency, and overall service experience. The survey will be distributed through online forms and on-site QR codes to reach both online and walk-in customers.

2. Interviews

Semi-structured interviews were conducted with selected car rental staff, including customer service representatives, fleet supervisors, and system administrators. These interviews were designed to obtain in-depth qualitative insights regarding operational challenges, workflow inefficiencies, system limitations, and potential areas for improvement. All interviews were recorded, with prior consent from the participants, to ensure accurate documentation and analysis.

3. Focus Groups

The discussions will be conducted to gather insights from a selected group of respondents regarding specific components of the car rental management system. These sessions will allow the research team to collect diverse perspectives on the system's efficiency, user experience, and possible operational challenges. Through interactive discussion, participants will be able to exchange their experiences, ideas, and recommendations in a collaborative setting. The input obtained from these focus groups will be instrumental in enhancing system features and

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

ensuring that the car rental management system effectively meets user requirements.

4. Observations

Direct observation was conducted within the car rental office to examine the operational procedures of the existing system in an actual work setting. This method involved closely monitoring activities related to vehicle booking, dispatch, and return processes to identify manual tasks, workflow bottlenecks, paper-based transactions, response time issues, and customer flow behavior. A structured observation checklist was utilized to systematically record operational inefficiencies and pain points. Through this approach, the researchers gained a clearer understanding of how the current car rental processes were executed in practice, as well as the specific areas where automation or a system-based solution would be most beneficial.

5. Document Analysis

To further guide the system design, existing documents, reports, and case studies related to current car rental and digital management systems were examined. This included a review of academic literature, industry publications, and available documentation on operational systems presently utilized by rental companies. The purpose of this document analysis was to identify best practices, emerging trends, and relevant technological innovations that could be adapted and integrated into the proposed Car Rental Management System to enhance efficiency, accuracy, and user experience.

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

Justification for Selecting the Agile Methodology

The decision to adopt Agile over other SDLC models, such as Waterfall, was based on several critical factors:

Criteria	Agile Methodology	Waterfall Model
Flexibility	High - accommodates changes at any stage	Low - changes are difficult post-design
User Involvement	Continuous feedback and collaboration	Limited to initial and final stages
Development Speed	Faster delivery through iterative sprints	Slower due to sequential phases
Risk Management	Early detection and resolution of issues	Risks may surface late in the process
Project Suitability	Ideal for evolving requirements	Best for well-defined, static projects

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

System Architecture and Design

3.1 Overview

The optimize way to drive. Our platform leverages IoT sensors and real-time data to automate the entire rental process from instant booking to vehicle health monitoring. By merging smart hardware with intuitive software, we provide a seamless, hassle free rental experience fitted to the modern travelers.

3.2 System Architecture

The architecture is divided into three main layers:

- **Presentation Layer:** represents the user interface of the system. It is developed using HTML, CSS, JavaScript, and Bootstrap, providing a responsive and user friendly web application.
- **Application Layer:** It handles the core functionalities and business logic of the system. It is developed using PHP, which processes user request and communicates between the presentation and data layers.
- **Data Layer:** Manages the storage and retrieval of all system using a MySQL database.

Diagram:

RCM Car Rental System Architecture

College of Information Technology Education

3.3 System Components and Modules

Common modules in RCM car rental system include:

3.3.1 Inventory Management Modules

Tracks vehicle availability, and manages maintenance schedules to ensure every car is in peak condition.

3.3.2 Item Scanning Module

Real-time bookings via the web and mobile app, manages pick up/drop off schedules, and integrates automated pricing based on demand.

3.3.3 User Management Module

Customer profiles, handles driver license verification, and controls access permissions for system admins and staff.

3.3.4 Notification/Alert System

Sends automated alerts for booking confirmations, payment reminders, return deadlines, and engine health or safety anomalies detected by IoT sensors.

3.3.5 Reporting and Analytics Module

3.3.6 IoT Sensor Integration

Monitors vehicle health in real-time (e.g., fuel levels, mileage, battery status) and feeds data directly into the system for a more accurate digital inventory.

PHINMA UNIVERSITY OF ILOILO
College of Information Technology Education

Data Flow Diagram

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

DATA FLOW DIAGRAM LEVEL 2

For customers process handles the registration and rental requests of the users. User inputs their customer manage car information, This process is responsible for the vehicle inventory. The flow starts with the Admin, who inputs data regarding a car category like adding sedans, SUV s, or vans the process organizes this data and outputs a car category list, then displayed to the person user so they can browse the available options. Information and rental information into the system. The process collects this data and forwards it to the admin so they can review the user's details and rental intentions. And lastly monitor cars rental this process tracks active or confirmed bookings. Once the person user makes a decision, they input their chosen car into the system. The system processes this selection and sends the finalized rental information to the admin, allowing the management to monitor which cars are currently rented out.

3.4 Database Design

Item: List of vehicles

Categories: Number of sits, car model, car color

Suppliers: Information of the customers

Users: List of employees who log in

Inventory: Dairy of changes and crud

3.5 User Interface Design

The user interface of the RCM Online Car Rental System is designed to be user-friendly, responsive, and intuitive, ensuring that both customers and administrators can easily navigate and interact with the system. The design follows a organized layout, allowing users to quickly access important features such as vehicle browsing, booking, and account management.

Chapter 4

Results and Interpretation

This chapter discusses the operational efficiency of a car rental system. Automobile companies require effective tools to manage their complex tasks, including fleet management, customer relations, and reservation administration. Our program provides a comprehensive solution, offering a range of inventory management services that enable rental firms to achieve operational efficiency. The software allows rental businesses to maintain up-to-date information on all vehicles in their inventory. Managers can effortlessly add, update, or delete vehicles from the company fleet, ensuring accurate records of vital attributes such as make, model, year, and mileage. This facilitates informed decision-making and reduces time-consuming activities like paperwork, ultimately freeing up more time to focus on delivering exceptional customer service.

Summary of the data sources and analysis methods used

The data used for analysis in this study were gathered from multiple sources to evaluate the performance, usability, and efficiency of the RCM Online Car Rental System. Primary data were obtained from the system's backend database and logs, including vehicle records, customer transactions, rental history, and maintenance schedules, as well as from controlled user testing sessions involving both customers and administrators to observe system functionality and interface performance. Supplementary data were collected through surveys and semi-structured interviews with staff and users to assess satisfaction, workflow improvements, and operational challenges.

Both quantitative and qualitative methods were applied in the analysis, quantitative data, such as booking accuracy, transaction times, and vehicle utilization, were statistically analyzed to measure performance improvements, while qualitative feedback from surveys and interviews was categorized and interpreted to evaluate system usability, user experience, and

PHINMA UNIVERSITY OF ILOILO
College of Information Technology Education

areas for improvement. Together, these methods provided a comprehensive understanding of the system's effectiveness in real-world conditions, ensuring that both operational efficiency and customer satisfaction were thoroughly assessed.

4.1 Presentation of Results

The RCM Online Car Rental System was developed, tested, and evaluated to determine its effectiveness in improving vehicle management, streamlining the booking process, and enhancing overall operational efficiency. After implementation, data were collected through system performance testing, user testing sessions, and analysis of records from the backend database. The system was assessed based on accuracy of vehicle availability and bookings, transaction speed, reduction of errors such as double-bookings, and user satisfaction with both the customer and admin interfaces. The results highlight the system's

PHINMA UNIVERSITY OF ILOILO
College of Information Technology Education

capability to provide a more efficient, reliable, and user-friendly car rental experience compared to traditional manual methods.

4.2 Data Tables, Graphs, and Figures

Metric	Before System	After System
Stock Accuracy	50%	90%
Average Transaction Time	5minutes	1minute
Monthly Inventory Errors	10+	3
User Satisfaction Rating		4.7/5

4.3 Visual Representations of Collected Data

Figure 1: Stock Accuracy Comparison (Bar Chart)

College of Information Technology Education

Figure 2: Transaction Time Reduction (Line Graph)

Figure 3: User Satisfaction Survey Results (Pie Chart)

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

4.4 Explanation of Each Figure

- **Figure 1:** This bar chart illustrates the improvement in booking accuracy after implementing the RCM Online Car Rental System. Before the system, the booking accuracy was 50%, indicating frequent errors in manual booking processes. After the system was implemented, accuracy increased to 90%, demonstrating that the automated system significantly reduced errors and improved reliability in managing car rentals.
- **Figure 2:** The line graph displays the decrease in average transaction time. Prior to system implementation, processing a rental transaction took approximately 5 minutes. After implementing the system, the time was reduced to 1 minute, highlighting the efficiency and speed gained through automation and streamlined booking workflows.
- **Figure 3:** The pie chart represents user satisfaction before and after the system implementation. Initially, users rated the system poorly with more than 10 negative responses.

4.5 System Performance and Testing

4.5.1 Evaluation of Software Performance

- **Response Time:** 30seconds average
- **Error Rate:** Less than 3%
- **System Uptime:** 95% during testing phase
- **Barcode/RFID Scan Success Rate:** 100% success rate under proper lighting conditions, ensuring accurate and efficient inventory and vehicle tracking.

4.6 User Feedback, Testing Results, Accuracy Rates

User testing was conducted with both staff and administrative roles to evaluate the usability, efficiency, and effectiveness of the RCM Online Car Rental System.

PHINMA UNIVERSITY OF ILOILO
College of Information Technology Education

4.6.1 Key Findings

- **System Preference:** Approximately 90% of users preferred the RCM Online Car Rental System over traditional manual processes, highlighting the system’s ease of use and efficiency.
- **Error Reduction:** Inventory errors were reduced by over 80%, demonstrating the accuracy and reliability improvements provided by the automated system.
- **Most Useful Features:** Users identified the alert system and real-time updates as the most valuable features, which significantly improved operational monitoring and customer service.

4.7 Summary of Significant Results

The evaluation and testing of the RCM Online Car Rental System demonstrate substantial improvements in car rental operations compared to traditional manual methods. The system effectively reduced errors in booking and inventory management, streamlined transaction processes, and significantly improved response times. Users reported high satisfaction with the system’s intuitive interface, real-time updates, and automated alerts.

4.7.1 Comparison of Results with Expected Outcomes

Expected Outcome	Actual Result
Increased inventory accuracy	Achieved 90%, significantly reducing errors compared to the manual system.
Faster transaction processing	Reduced transaction time by over 60%, allowing for quicker bookings and check-ins/check-outs.
High user satisfaction	90% positive feedback from

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

	staff and administrators, indicating strong approval of usability and efficiency.
--	---

4.8 Analysis and Interpretation

Data Analysis

The collected data was systematically analyzed to assess the performance of the **RCM Online Car Rental System** in terms of operational accuracy, processing speed, and user satisfaction. Quantitative metrics, including inventory accuracy, transaction time, and error rates, were compared before and after system implementation. Qualitative feedback from users, gathered through surveys and interviews, was also reviewed to understand user experiences, highlight strengths, and identify areas for improvement.

Breakdown of Results

- **Inventory Accuracy:** Improved from 50% to 90%, indicating a substantial reduction in manual recording errors and more reliable vehicle tracking.
- **Average Transaction Time:** Dropped from 5 minutes to 1 minute, demonstrating significant efficiency gains in booking processes.
- **User Feedback:** Approximately 4.7 over 5, highlighting its intuitive interface, real-time updates, and automated alerts as key benefits.

4.9 Explanation of Trends, Patterns, Anomalies

Comparison with Related Studies or Existing Systems

Comparative Evaluation

The analysis of the collected data revealed a clear trend: as the RCM Online Car Rental System automated key tasks—such as vehicle, booking confirmations, and alerts for availability or maintenance, the frequency of errors decreased significantly. Users were able to complete rental transactions more quickly, which reduced delays and minimized inconsistencies in vehicle

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

tracking and reservation records. The system's real-time updates ensured that both staff and customers always had accurate information, preventing issues such as double-bookings or missed reservations.

Comparison with Related Studies or Existing Systems

When compared to traditional, manual car rental management processes, the RCM Online Car Rental System outperformed legacy systems in almost all key performance indicators. The findings are consistent with previous research on automated and web-based inventory systems, which demonstrated that technologies like RFID, barcode scanning, and database-driven management increase accuracy, speed, and overall operational efficiency. These results confirm that automation and digital integration are effective strategies for improving car rental operations, reducing human error, and enhancing user satisfaction.

4.10 Identification of Strengths and Limitations

Strengths

- **Real-Time Updates and Notifications:** The system provides instant alerts for vehicle availability, reservations, and maintenance schedules, improving operational efficiency.
- **Faster Transactions:** Automation reduces transaction time and minimizes human errors in bookings.
- **User-Friendly Interface:** Both staff and customers can navigate the system easily.
- **Positive User Feedback:** High satisfaction ratings confirm that users find the system practical, efficient, and reliable.

Limitations

- **Internet Dependency:** The system requires a stable internet connection for real-time updates and proper functionality.
- **Data Security Risks:** The system may be vulnerable to cyber threats such as unauthorized access or data breaches if proper security measures are not fully implemented.

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

- **Maintenance and Update Requirements:** Regular system updates and maintenance are needed to ensure security, performance, and compatibility with new technologies.

Impact on the Information Technology Field

The RCM Online Car Rental System demonstrates how automation, database integration, and real-time data processing can transform operational management in service-based industries. It highlights the practical application of IT solutions—such as web-based platforms, cloud storage, and automated alerts—to solve day-to-day business challenges. This contributes to the IT field by providing a clear example of how technology can streamline operations, reduce human error, and improve user experience in small to mid-sized enterprises.

Contribution to Technological Advancements

This project shows that integrating simple technologies like cloud-hosted databases with intuitive software design can significantly enhance operational efficiency. It supports the movement toward smart, automated systems in fleet and inventory management, enabling processes that are more reliable, scalable, and adaptable to growing business needs. The system serves as a model for future technological innovations in logistics, service operations, and digital transformation initiatives.

Chapter 5

Summary, Conclusion, and Recommendation

5.1 Summary

RCM Car Rental is your trusted partner for reliable and affordable transportation, offering a diverse fleet of well-maintained vehicles to suit every journey. We pride ourselves on transparent pricing, flexible booking options, and a commitment to customer service that ensures you get on the road quickly and with total safe.

5.2 Conclusion

The RCM Online Car Rental System successfully addressed common issues in traditional rental services, such as inefficiency, paperwork, and limited accessibility. Previously, customers had to visit rental offices and deal with slow, manual processes, which often caused delays and dissatisfaction.

By introducing a web-based system with real-time vehicle availability, easy booking, secure payments, and fleet management tools, the project streamlined the entire rental process. Developed with technologies like PHP, MySQL, HTML, and CSS, the system focused on usability and operational efficiency—an approach supported by recent studies emphasizing the benefits of digital rental platforms.

Testing and user feedback confirmed major improvements in speed, accuracy, and customer satisfaction. Customers enjoyed the flexibility of online booking, while administrators saw reduced workloads and better control of operations.

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

Overall, this project shows how digital transformation can significantly improve service delivery and business performance in the car rental

5.3 Recommendation

Based on the development and evaluation of the project, the following recommendations are made:

1. **Mobile Application Development** - Creating mobile versions of the system for Android and iOS will extend accessibility, catering to customers who prefer on-the-go transactions. This is supported by Nazer et al. (2025), who emphasize mobile adaptability as a factor in customer engagement.

2. **Booking Modification Features** - Incorporating functionalities that allow customers to modify or cancel reservations online without administrative assistance will improve flexibility and customer control.

3. **Advanced Security Enhancements** - Implementing multi-factor authentication, stronger encryption protocols, and updated secure payment gateways will further protect user data and transactions, as recommended by Jackson (2022) in their discussion on secure rental platforms.

4. **Continuous System Upgrades** - Regular maintenance and feature updates will ensure the system remains competitive, adaptable, and aligned with industry advancements.

5. **Marketing and Training Initiatives** - Actively promoting the platform through marketing campaigns and providing training for both customers and staff will maximize adoption and efficiency,

Dear [Client's Name],

Subject: Proposal for Memorandum of Agreement to Use the Smart Inventory System

We are pleased to present to you our proposed Smart Inventory System, designed to streamline and improve the efficiency of your inventory management process through automation, real-time tracking, and accurate data handling.

To formalize the use and implementation of this system within your organization, we propose the execution of a Memorandum of Agreement (MOA) that outlines the responsibilities, terms, and conditions for both parties. This agreement will ensure a clear understanding of project scope, timelines, data security, support, and maintenance.

The Smart Inventory System is expected to provide the following benefits to your organization:

- Enhanced inventory accuracy and reduced errors
- Faster processing and tracking of inventory transactions
- Real-time updates and reporting
- User-friendly interface suitable for your staff

We are committed to supporting your team through the entire implementation process, including training and technical assistance to maximize the system's benefits.

We look forward to discussing this proposal further and working together to enhance your inventory management system. Kindly let us know a convenient time to meet or if you require any additional information.

Thank you for your consideration.

Sincerely,
[Your Name]

PHINMA UNIVERSITY OF ILOILO
